POSTER PRESENTATION 2026

REACT NATIVE

ORDER & SALES MANAGEMENT APP

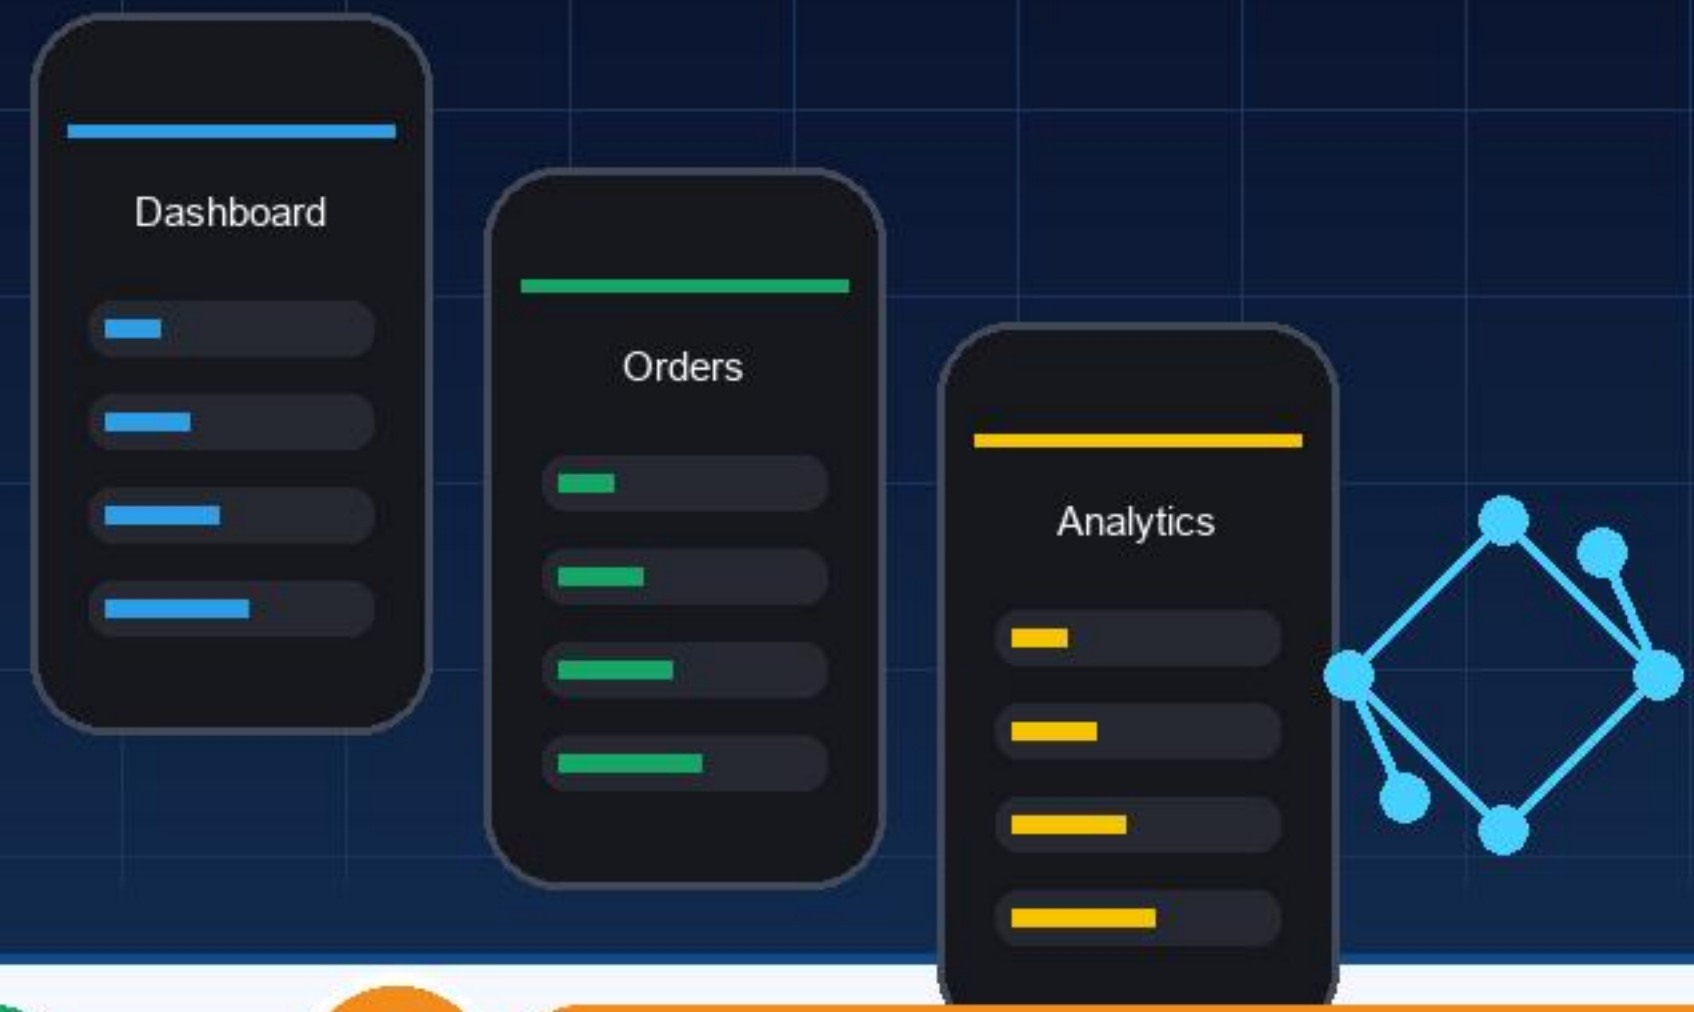

Mobile-first Create > Approve > Dispatch > Analyze workflow for field sales teams, managers, and warehouse staff.

Expo

TypeScript

Node.js API

Google Sheets

I

INTRODUCTION

Field sales teams often write shop orders in notebooks, then re-enter them into Tally ERP. Managers manually check ledgers before approval and warehouse staff depend on printed dispatch lists. This creates delay, duplicate entry, limited visibility, and weak real-time control.

A

ABSTRACT

This project presents a React Native mobile application for small-to-medium distributors. It enables field sales representatives to create orders instantly, managers to approve with embedded customer ledger visibility, and warehouse staff to process dispatch digitally. The Expo frontend connects with a Node.js/Express demo backend and Google Sheets data flow.

O

OBJECTIVES

- ✓ Eliminate duplicate notebook-to-Tally order entry.
- ✓ Create sales orders on mobile in under 60 seconds.
- ✓ Reduce approval time using embedded ledger context.
- ✓ Track order status from pending to dispatched.
- ✓ Provide mobile analytics for managers and owners.

T

TECHNOLOGY / METHODS / ALGORITHM

Technology

- **Frontend**
React Native + Expo
- **Language**
TypeScript
- **Routing**
Expo Router
- **Backend**
Node.js + Express.js
- **Data Store**
Google Sheets API
- **State/Cache**
Context + AsyncStorage
- **Charts**
react-native-svg

Methods

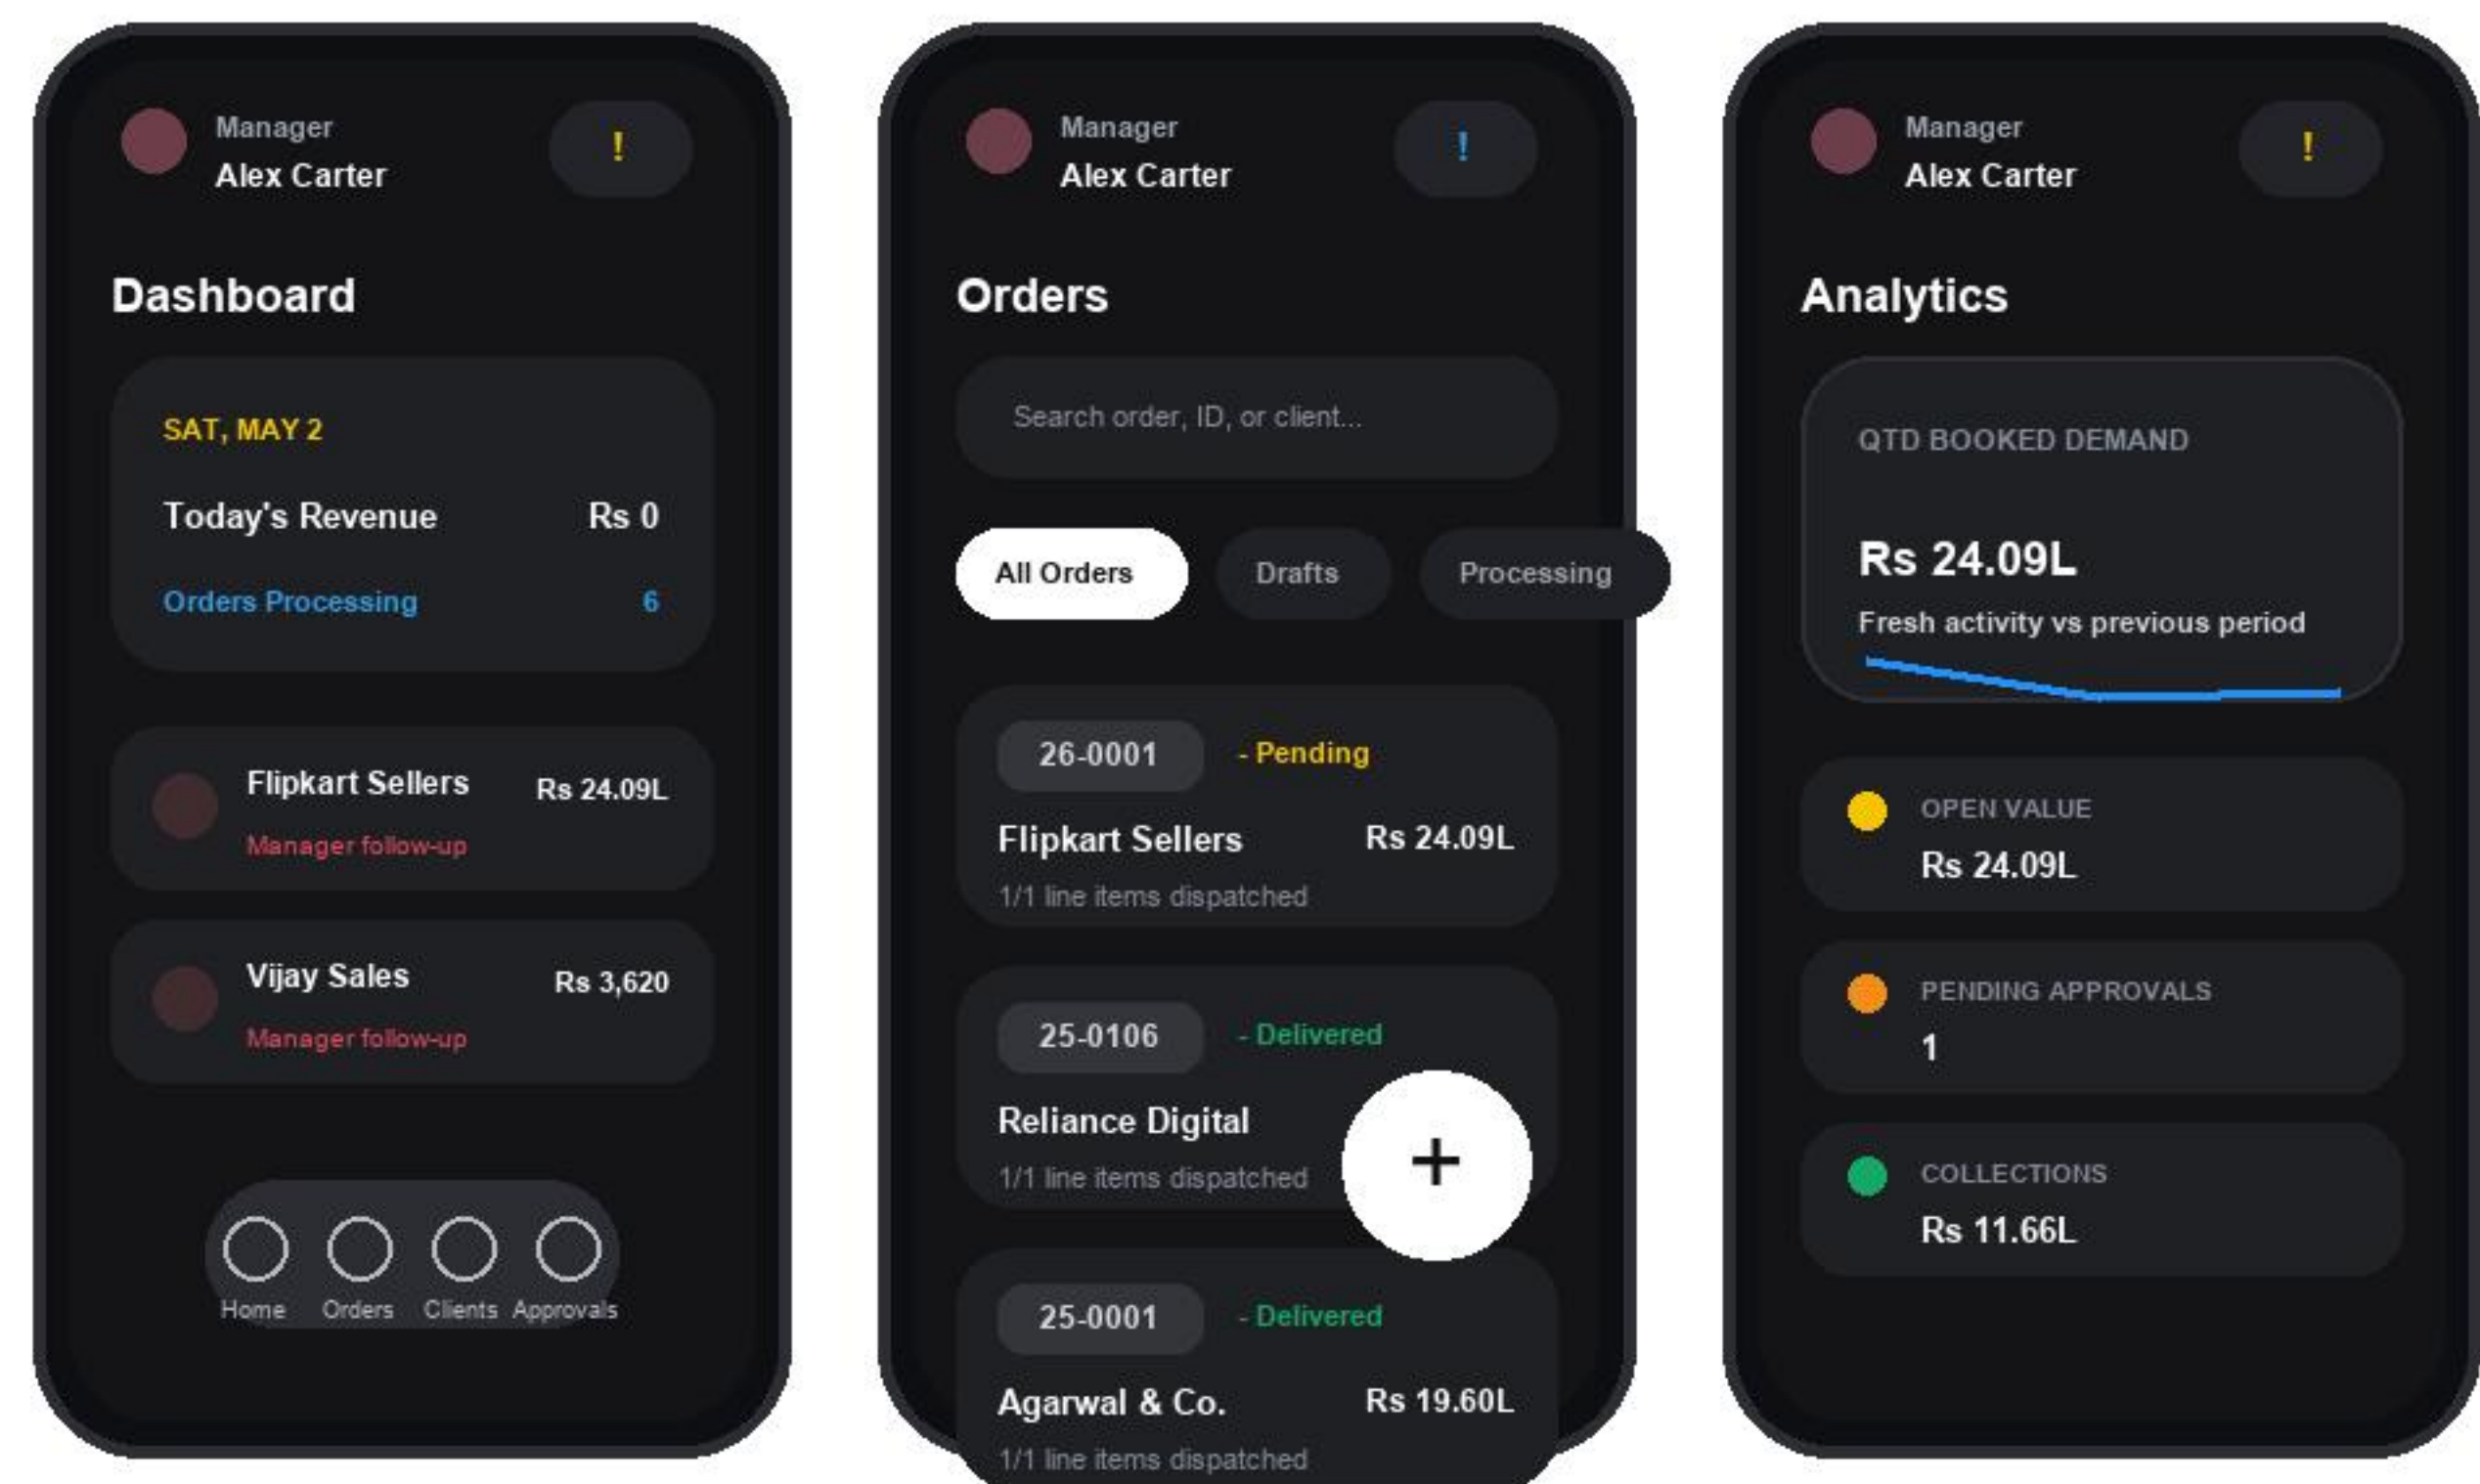

- Design thinking and empathy mapping
- Role-based UX for sales, manager, warehouse
- REST API integration with demo backend
- Sheets-backed validation using realistic records
- Responsive mobile-first interface testing

Algorithm / Logic

- Login and load role-specific dashboard
- Create order with customer/product lookup
- Manager checks embedded ledger and approves
- Warehouse marks dispatched with timestamp
- Analytics summarizes revenue, orders, and risk

P

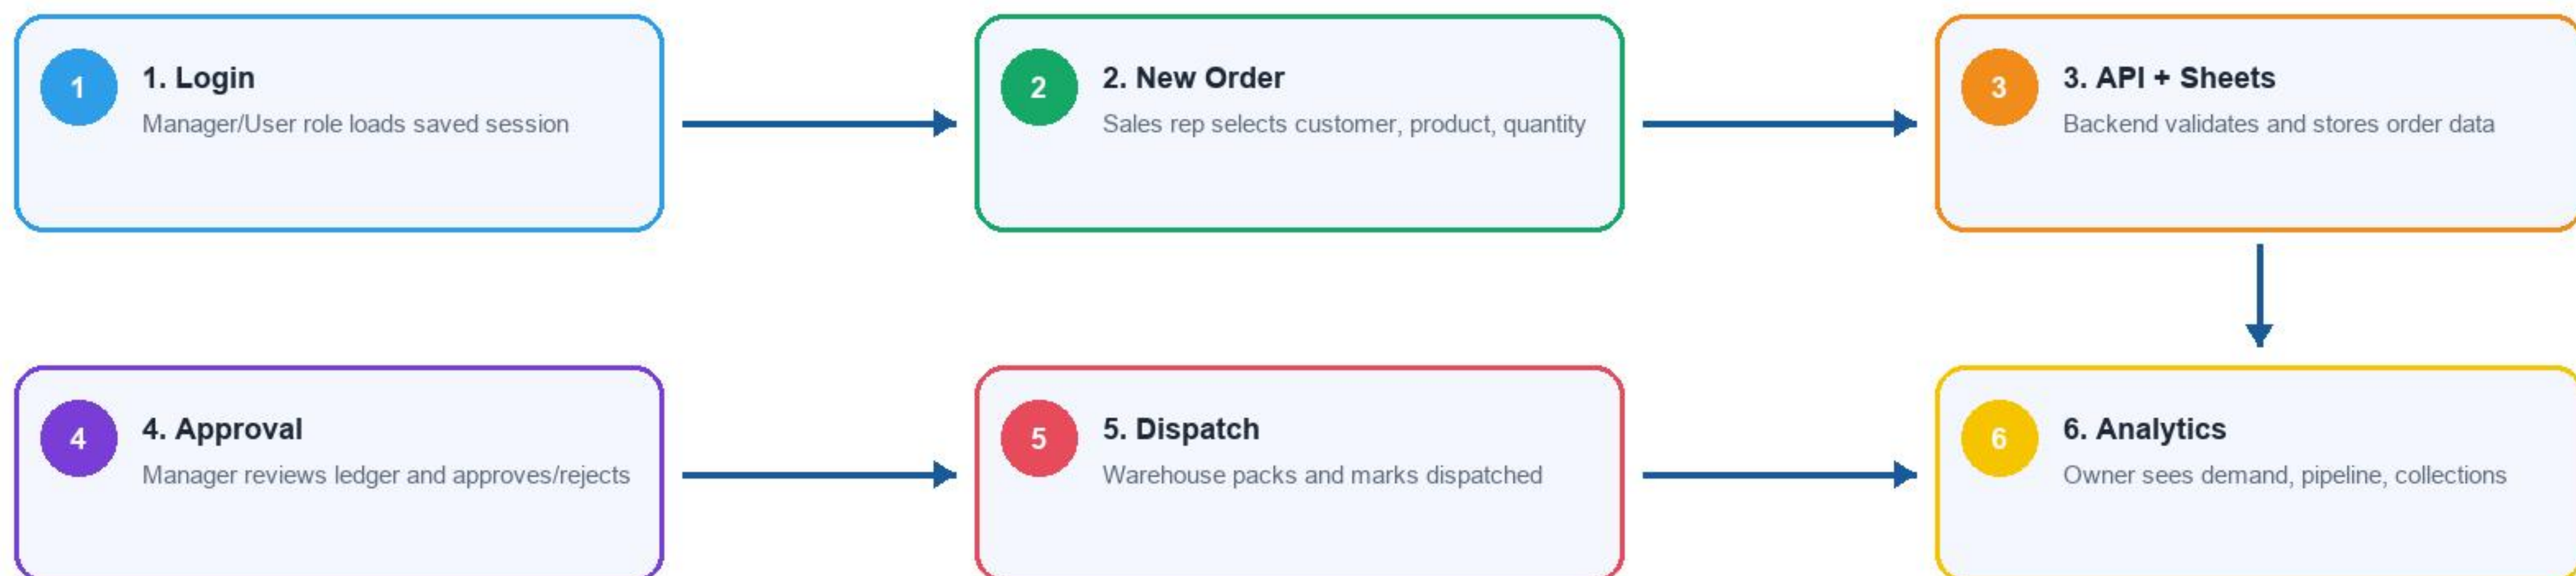

PROTOTYPE

Dark mobile prototype: dashboard, orders, and analytics.

W

WORKFLOW / PROCESS / FLOW CHART

R

RESULTS / OUTCOME

- ✓ Demonstrates complete order lifecycle: create, approve, dispatch, and analyze.
- ✓ Order creation target reduced to under 60 seconds for field sales reps.
- ✓ Manager approval target reduced to under 2 minutes using embedded ledger visibility.
- ✓ Google Sheets data flow validates realistic customers, products, orders, and analytics.
- ✓ Role-based interface improves clarity for sales reps, managers, and dispatch staff.

C

CONCLUSION

The React Native Order & Sales Management App provides a practical mobile-first solution for traditional Tally-based order workflows. It removes duplicate data entry, improves credit-check decisions, creates digital dispatch records, and gives managers real-time business visibility through a connected mobile prototype.

F

FUTURE SCOPE

- ✓ JWT-based authentication and stronger backend validation
- ✓ Push notifications for pending approvals and order status changes
- ✓ Offline synchronization for low-network field visits
- ✓ Tally ERP CSV import/export pipeline for production data
- ✓ Date-range filters and deeper analytics for owner command center
- ✓ Barcode scanning and voice notes for faster order entry
