

REACT NATIVE

Order & Sales Management App

A mobile-first order lifecycle instrument for field teams: create orders, approve with ledger context, dispatch digitally, and monitor live sales risk.

Create > Approve > Dispatch

Live OMA prototype

INTRODUCTION

Problem context

Traditional field sales depends on notebooks, Tally checks, phone calls, and printed dispatch lists. This creates duplicate entry, approval delay, and weak real-time control.

ABSTRACT

Project summary

The React Native app connects sales reps, managers, and warehouse staff through an Expo frontend, Node.js REST API, and Google Sheets-backed operational data flow.

OBJECTIVES

Measurable goals

Eliminate duplicate entry, create orders in under 60 seconds, reduce approval time with ledger visibility, track dispatch, and surface owner analytics.

TECH

Technology / methods

- RN React Native + Expo
- TS TypeScript
- API Node.js + Express.js
- DATA Google Sheets API
- STATE React Context + AsyncStorage
- CHART react-native-svg

Methods

- Design thinking and empathy mapping
- Role-based mobile UX
- REST API integration
- Sheets-backed validation
- Prototype verification with demo data

Algorithm / logic

- Login -> role dashboard
- Order -> API -> Sheets
- Ledger review -> approval
- Dispatch timestamp -> analytics

PROTOTYPE

Working screens

Correct prototype screenshots from the OMA dark mobile interface.

Orders

Analytics

Approvals

Dispatch

FLOW

Workflow / process

- Sign in**
Manager or worker role opens the OMA workspace.
- Create order**
Sales rep selects client, product, quantity, and source.
- Review ledger**
Manager checks exposure, credit status, and order value.
- Approve / reject**
Decision updates order status and queue priority.
- Dispatch**
Warehouse picks items and records fulfillment timestamp.
- Analyze**
Owner dashboard shows demand, collections, and risk.

RESULTS

Outcomes

- Create -> Approve -> Dispatch flow demonstrated.
- Order creation target under 60 seconds.
- Ledger visibility reduces approval friction.
- Sheets data validates realistic records.

CONCLUSION

Business value

The React Native Order & Sales Management App replaces manual order handoffs with a mobile-first workflow for field sales, manager approval, digital dispatch, and owner analytics.

FUTURE

Next scope

- JWT authentication and backend validation
- Push notifications for order status
- Offline synchronization for field visits
- Tally ERP CSV import/export pipeline
- Barcode scanning and voice notes
- Date filters and deeper analytics
